#### AUFGABE 1: RAUSCHANALYSE

## AUFGABE 1: RAUSCHANALYSE

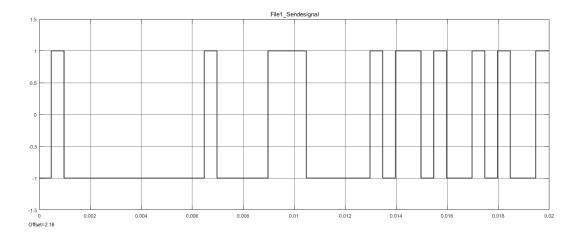

#### AUFGABE 1: RAUSCHANALYSE

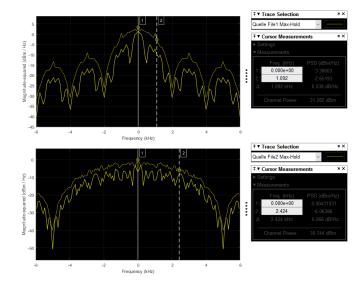

AUFGABE 1

000

```
xmue1 = mean(n1)
var1 = var(n1)
...
```

```
Signal Mittelwert Varianz n_1(t) = -0.06 4.00 n_2(t) = 0.96 3.94
```

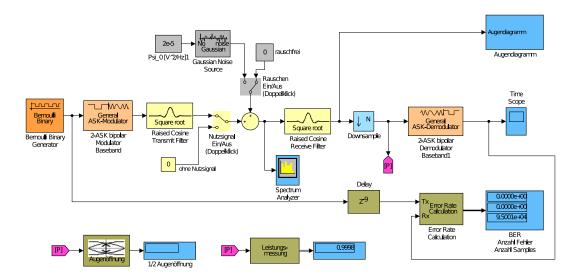

Signal	Datenrate (BR)	Bandbreite (6 dB (B))
File 1	$2.001{\rm kbits^{-1}}$	1.092 kHz
File 2	$5.006{\rm kbits^{-1}}$	$2.424\mathrm{kHz}$

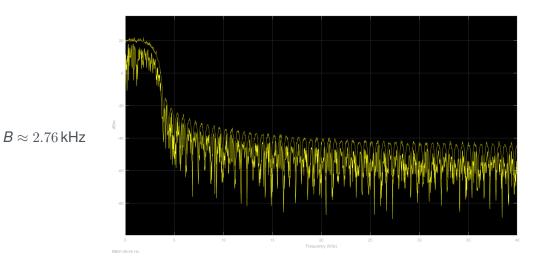

Inetwa linearer Zusammenhang:

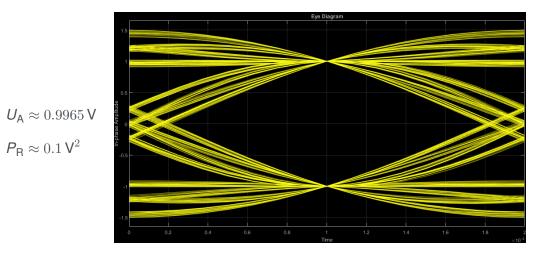

$$B pprox rac{1}{2} \cdot BR = rac{1}{2} \cdot rac{1}{T_S}$$

 $\rightarrow$  Bandbreite bei 1 kbit s<sup>-1</sup>:

$$B \approx \frac{1}{2} \cdot 1000 \, \mathrm{kbit \, s^{-1}} = 500 \, \mathrm{Hz}$$

$$\mathsf{BER} = \frac{1}{\log_2 s} + \frac{s-1}{s} \cdot \mathsf{erfc}\bigg(\sqrt{\frac{\rho}{2}}\bigg), \, s = 2$$

BER = 
$$0.5 \cdot \text{erfc}\left(\sqrt{\frac{9.93}{2}}\right) = 8.1303 \cdot 10^{-4}$$

gemessen:

$$BER_q = 8.86315 \cdot 10^{-4}$$

# Aufgabe 4: Änderung des Empfangsfilters

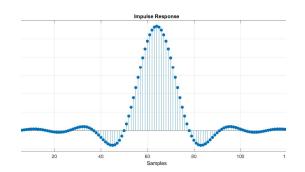

$$B=2.76\,\mathrm{kHz}$$

$$U_{\Delta} = 0.8651 \, \text{V}$$

$$P_{\rm B} = 0.09861 \, \rm V.^2$$

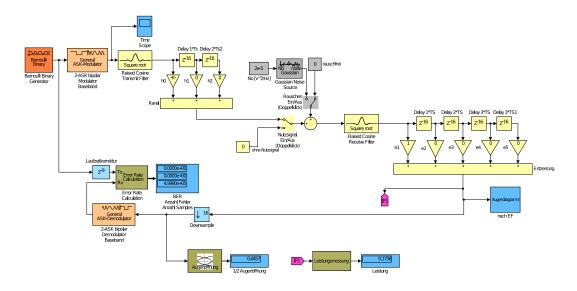

$$\rho = \frac{U_{\mathsf{A}}.^2}{P_{\mathsf{B}}} = 7.59$$

$$BER = 2.9 \cdot 10^{-3}$$

# AUFGABE 4: ÄNDERUNG DES EMPFANGSFILTERS

$$g_{\rm ef}(t) \neq g_{\rm s}(-t)$$

$$g_{\mathsf{k}}(t) = \frac{1}{\sqrt{5}} \cdot \delta(t)$$
